

Problems and solution in broiler and pig houses

Problem	Solution	Chance to have the same problem again in a new set-up/installation	Things to take care of/to check	Suggestions
Hidden heating in ceiling (broiler house)	Ask farmer to put on heating, to find out where hot tubes are located	Probably only in broiler houses, not in pig houses	Make sure no equipment is placed close to the hot tubes, risk of overheating	Place all equipment at least a few meters away from hot water tubes
Height worker cannot drive in broiler house when litter is spread out	Only work in broiler houses when there is no litter	Problem always actual in broiler houses	Height worker with sufficient battery power	Do not attempt repairs in broiler houses when there is litter in the house
Very high ceilings	Height worker when possible (~broiler houses), very long ladders when not possible (~pig houses)	Problem always actual	Height worker/very long and secured ladder	Use height worker if available; when using ladders, make sure it is definitely long enough
Asbestos in houses	Do not drill holes in asbestos	Problem actual in older buildings, and in less developed countries	Make sure no holes are drilled in asbestos	Be careful with asbestos
Farmer wants cable to go in tube under the ground	With wire to pull cable, pull all cables through	Problem actual when animal house in other building than office	Sufficient personnel, sufficient time, sufficiently long cable to pull secondary cable through the tube	This is a very time-consuming process, and very intensive as well. Make sure enough personnel + time is foreseen.
